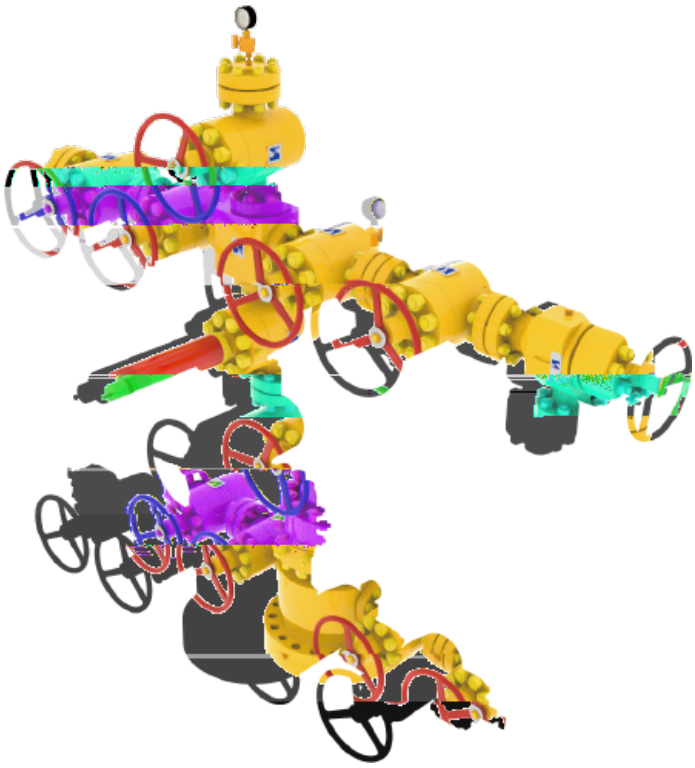
Wellhead Oil Recovery

Medium and high-end wellhead equipment and manifolds

Integrated wellhead device for injection and production

eference standards: API 6A, ISO10423, GB/T22513 and NACE 0175

This product is mainly used in natural gas injection condition of gas storage to meet the needs of gas injection and other production and operation functions.



Product Features

- Independent gas injection and production channels formed by optimizing the wellhead structure
- Monitoring wellhead pressure and temperature, and realizing automatic safety control through surface safety valve and underground safety valve
- Designed with the functions of connecting the well killing, blowout and testing pipelines
- Higher reliability and operability ensured through low torque of gate valve and metal-to-metal sealing
- The all-metal sealed device is suitable for working in conditions of high pressure, corrosion and other harsh conditions
- Stable and reliable in long-term use, with a long service life

Safety control

Realize automatic safety control through surface safety valve and underground safety valve

Testing connection

With the functions of connecting the well killing, blowout and testing pipelines

All-metal sealed device

The all-metal sealed device is suitable for working in conditions of high pressure, corrosion and other harsh conditions.
